

WHATYOU WILL NEED:

SM 1923

<u>Sure</u> <u>Stamp</u>

Sure Bond

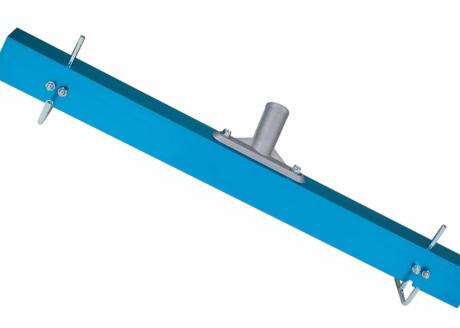

Color Packs

Heavy Duty Bucket

<u>GSR</u> <u>Release</u>

Pool Trowel

SCR

Control of the second s

Touch-Up Wheel

Pump Sprayer

HS200 Sealer

Epoxy
Glide
Roller

Prep Work

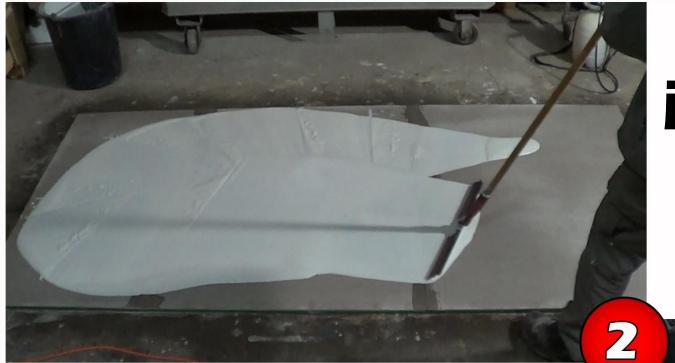

Prep work is the most important part of any overlay installment.

Improper/insufficient prep work will ultimately cause in overlay failure, delamination and chipping. Even brand new concrete needs a small amount of prep for a proper bond between the concrete and the overlay.

Any existing concrete must be grinded to expose the pores and to remove any surface contaminates.

Any holes, cracks or imperfections must be patched before the overlay application

Then <u>SureBond</u> is applied to the prepped concrete

SureBond is a primer which ensures a proper bond between the overlay and concrete

<u>SureStamp</u>

SureStamp is a super durable stamped concrete overlay. It is formulated specifically to adhere to existing concrete, a feat which regular concrete can never accomplish. The mix is a white concrete slurry which can be pigmented to a wide range of colors with the **SureCrete Color** Packs. The dosage rate is 1 color pack per bag of **SureStamp**. The Water dosage is 2.5-3.5 quarts per bag but we always recommend starting with the minimum amount and adding water if need be.

The color I used is "Smoke"

Mix the color pack into the water first for proper pigment distribution

Then mix in your SureStamp in with the pigmented water

Pour the <u>material</u> in gradually for easier/faster mixing.

Dry <u>material</u> is still stuck to the sides and bottom of the <u>bucket</u>.

Scrape the sides/bottom and then mix one last time

Spread the material at the desired height with a gauge rake

The thickness needs to be just enough to exceed the height from the lowest to the highest point on the stamp.

Smooth the material with a pool trowel

Any imperfections on the surface might translate into the stamped texture

Stamping The SM 1923 stamp series is a

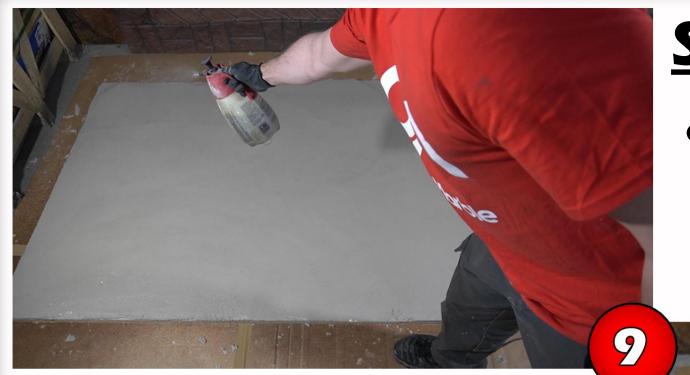

slate textured stamp series. You can purchase them separately or in sets of 5 or 8. The amount of stamps you actually need should be enough to span the width of your concrete slab, plus two more to continue the next row of stamps.

stamping when you can press your finger into it, but nothing sticks to your finger

You can start

The time will always depend on weather conditions. The hotter it is, the faster the material sets

Spray GSR release agent on to both the SureStamp and the stamps

The <u>release</u> ensures no <u>material</u> gets stuck to the <u>stamp</u> mats

Start

stamping the concrete

Use a tamper if the material cured too much

Continue
stamping with
the other
stamps

Each <u>stamp</u> color was casted from different stones to minimize repetition

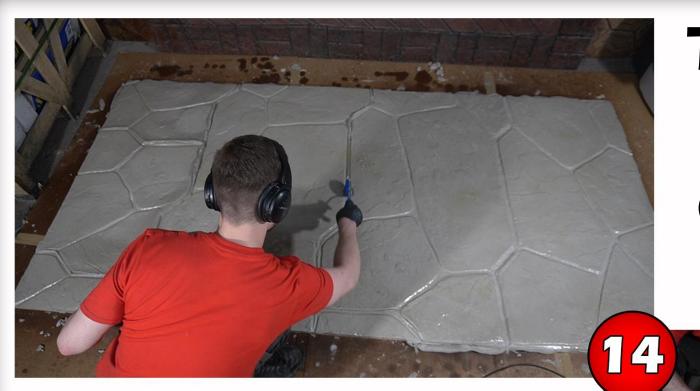

In tight to reach areas a floppy mat may be used

They are slightly smaller than the rigid stamps for ease of handling

Remove stamps from the concrete once tamped

I applied too much SureStamp and some got squeezed out between the stamps

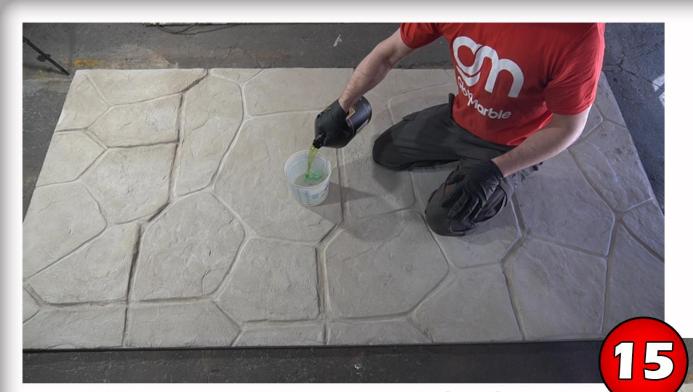

The joints can be patched and corrected with a touch up wheel

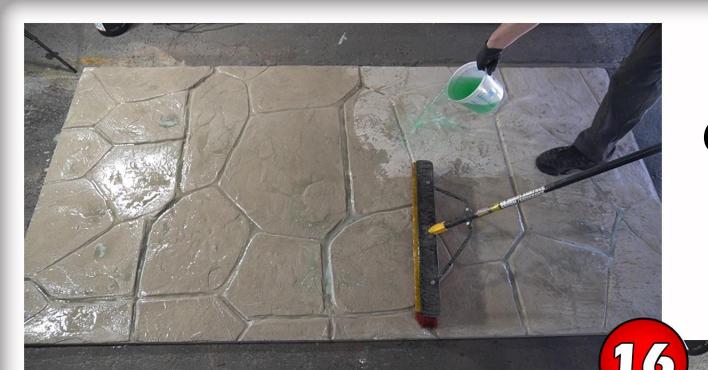

Staining

Staining is a secondary coloring method which accents the stones and makes them look 100X more natural. **EcoStain** is a water based stain which is very easy to alter the appearance of unlike acid based stains. If the color has not settled where you want it to, you may use a wet sponge to manipulate the stain even after it has already dried.

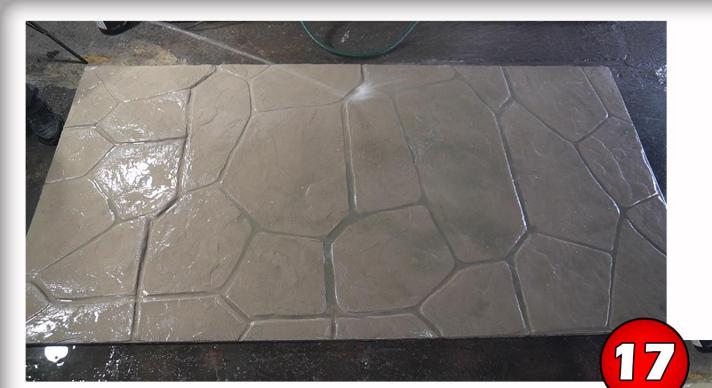

The oily release agent must be removed before moving forward

Dilute the <u>SCR</u>
<u>degreaser</u> 3
parts water to 1
part <u>SCR</u>

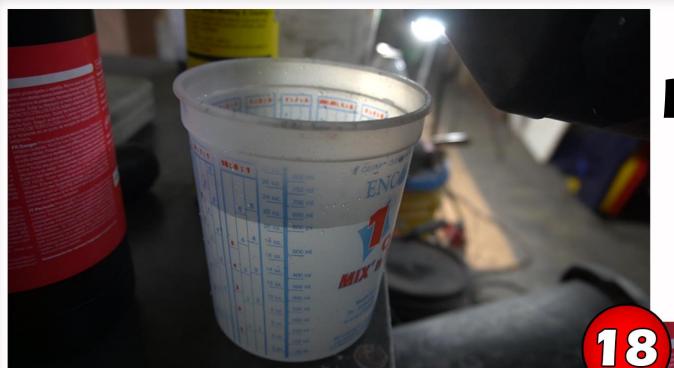

Scrub it into the concrete surface with a thick bristle brush

Keep the <u>SCR</u> wet and do not let it dry. If it starts drying spray it with some more water

Dry <u>SCR</u> might damage or discolor the concrete

Once thoroughly scrubbed, wash the <u>SCR</u> off of the <u>SureStamp</u>

To match the color chart, dilute it at a 3:1 ratio

The EcoStain is a powerful concentrate which can be diluted with water to different strengths.

Pour the EcoStain into a pump sprayer and pump it up full of air

Pump sprayers allow a continuous spray of material while holding down the trigger

Spray the stain onto the concrete

The color I used was "Titanium Gray"

If desired, use a secondary color for a bit of variety

The color I used is "Kayak"

OPTIONAL Color the grout lines

I find that darker colored grout lines look most natural

Sealing

A sealer must be applied not only to lock in the color of the concrete, but also to protect it from abrasions / UV radiation. Any sealer will give the concrete a color enhancing effect similar to the effect of water. The sealer must be applied 7 days after the pouring of the **SureStamp** to ensure all the moisture has escaped

Once dry,
you can <u>seal</u>
the concrete

Be sure to <u>backroll</u> to ensure even coverage and eliminate roller marks
